

Consolidated™ 1900/1900 DM Series Safety Relief Valves

With the Eductor Tube Advantage™

The highly adaptable 1900 & 1900 Dual Media (DM) Series Safety Relief Valves are designed to meet numerous application requirements.

Table of Contents

Conversion Table	2
1900/1900 DM Overview	3-6
How Pressure Relief Valves Operate	7-8
Product Features	9-10
1900 Dual Media (DM) Certified Valves	11-12
Design Options	12
1900 Dual Media (DM) Cryodisc	13
1900 Dual Media (DM) High Pressure (Block Body)	13
1900 Steam Trim (TD) Valves	14
1900 Liquid Trim (LA & LA1) Valves	15
1900 Restricted Lift Valves	16
Soft Seat Applications	17
1900/1900 DM Soft Seat (DA) Option	18
Soft Seat (DA) Option - How the Double Seal Works	19
Materials	20-44
1900/1900 DM Conventional Safety Relief Valve.....	20
1900/1900 DM Materials of Construction - Conventional.....	21
1900/1900 DM Balanced Bellows Safety Relief Valve	22
1900/1900 DM Materials of Construction - Balanced Bellows	23
1900/1900 DM Balanced Piston Safety Relief Valve.....	24
1900/1900 DM Materials of Construction - Balanced Piston.....	25
1900/1900 DM Soft Seat (DA) Option Safety Relief Valve.....	26
1900 Steam Trim (TD) Option Safety Relief Valve	27
1900 Liquid Trim (LA & LA1) Option Safety Relief Valve.....	28
1900/1900 DM Special Material and Service Options.....	29
NACE Trims	30
Hydrofluoric Acid (HA) Service	31
Corrosive Service.....	32-38
Low Temperature.....	39-40
High Temperature.....	41
Valves for Lethal Service.....	42
1900/1900 DM O-ring Selection.....	43-44

Accessories	45-51
Caps, Levers, and Accessories.....	45-46
Valve Position Indicators.....	46
Packed Lever / Plain Lever.....	47
Bolted Cap / Cap with Gag.....	48
Cap with Gag.....	48
Cap and Lever Construction.....	49-50
Bolt-on Jackets.....	51
Dimensions and Weights.....	52-60
1900/1900 DM Flanged Series Conventional Safety Relief Valve.....	52
D and E Orifice.....	53
F and G Orifice.....	54
H and J Orifice.....	55
K and L Orifice.....	56
N and M Orifice.....	57
P and Q Orifice.....	58
R and T Orifice.....	59
U, V, and W Orifice.....	60
Pressure and Temperature Tables	61-90
Selection Charts for Vapors, Gases and Liquids.....	61-90
1900 GS/1900 DM Capacities	91-92
1900 TD Capacities.....	93-94
1900 LA/LA1 & 1900 DM Capacities	95-96
1900 TD Superheat Correction.....	97
1900/1900 DM Series Valve Configuration Code	98-100
1900 DM Series API 10/15K Valve Configuration Code.....	101-102
Ordering a 1900/1900 DM Safety Relief Valve.....	103

Baker Hughes provides a full range of Consolidated pressure relief valve styles, sizes, options and configurations for multiple industries, applications, environments, and media. From spring-actuated to pilot-operated, each pressure relief valve is configured to offer safer process flow control in harsh environments.

Conversion Table

All the USCS values are converted to metric values using the following conversion factors:

USCS Unit	Conversion Factor	Metric Unit
in.	25.4	mm
lb.	0.4535924	kg
in ²	6.4516	cm ²
ft ³ /min	0.02831685	m ³ /min
gal/min	3.785412	L/min
lb/hr	0.4535924	kg/hr
psig	0.06894757	barg
ft lb	1.3558181	Nm
°F	$5/9 (°F - 32)$	°C

Scope of Design

How Pressure Relief Valves Operate

All pressure relief valves operate by using inlet-system pressure to overcome a spring load. As a result, the valve can relieve a defined capacity.

Closed

When the valve is closed during normal operation (see Figure Closed), the spring force resists the vessel pressure acting against the seating surfaces (area A). As vessel pressure increases, the pressure at (A) tends to equalize the spring force and the pressure holding the seats together approaches zero.

Partially Open

In vapor or gas service the valve may “simmer” before it will “pop.” When the vessel pressure increases to within one to two percent of the set pressure, media will audibly move past the seating surfaces into Chamber (B). Flow restriction in the secondary annular orifice causes pressure can now

act over a larger area, an additional force is available to overcome the spring force. By adjusting the “adjusting ring”, the opening in the secondary annular orifice can be altered, which controls pressure build-up in chamber (B). This controlled pressure build-up in chamber (B) will overcome the spring force, causing the disc to move away from the nozzle seat and the valve to “pop” open.

Fully Open

Once the valve has opened, an additional pressure build-up occurs at (C) (see Figure Fully Open). This is due to the sudden flow increase and the restriction to flow through another annular orifice formed between the inner edge of the disc holder and the outside diameter of the adjusting ring. These additional forces at (C) cause the disc to lift substantially at “pop.”

Flow is restricted by the opening between the nozzle seat and disc seat until the disc seat has been lifted from the nozzle seat by approximately one-quarter of the nozzle-throat diameter. After the disc has attained this degree of lift, flow is restricted by the primary orifice rather than by the area between the seating surfaces.

Blowdown (the difference between opening and closing pressure) can be controlled within limits by positioning the single adjusting ring. Blowdown is caused when the spring force is unable to overcome the summation of the forces at (A), (B), and (C) until the pressure at (A) drops below the set pressure.

Scope of Design

How Pressure Relief Valves Operate

Flow path of fluid through the valve

Note:

Above Figure reflects the flow path of fluid through the valve. It is significant to recognize that the system pressure enters through the nozzle and remains at a high pressure until it expands through the secondary annular orifice. Pressure downstream of the secondary annular orifice is much lower than the system pressure. The upper portion of the valve base plus the outlet flange are of a lower pressure rating than the inlet side of the valve.

Blowdown settings: Production testing required by manufacturers of safety relief valves is governed by ASME Section VIII, UG-136 (d), which does not require the setting of blowdown during production test. Adjusting rings on the 1900 flanged safety relief valve series are factory adjusted to predetermined ring settings. This will provide a consistent opening and closing pressure on the safety relief valve.

Scope of Design

Product Features

Adjusting Ring

The adjusting ring in the Consolidated safety relief valve is preset to predetermined positions before the valve is put into service. Presetting makes it less necessary to pop the valve in service in order to ascertain that the ring has been set properly to achieve the necessary lift and relieving capacity.

Simple Blowdown Adjustment

A single adjusting ring adjusts blowdown, or reseating pressure, in the safety relief valve. When the ring is moved upward, blowdown is increased (lowering the reseating pressure), and when it is moved downward, the blowdown is decreased (raising the reseating pressure). In comparison, when valves have two or more adjusting rings, each affects valve action as well as blowdown.

Minimum Guiding Area

Guiding areas greater than those required to align the seating surfaces are undesirable in a safety relief valve, especially for valves used in the process industries. The smaller the valve's guiding area (when corrosion or contamination from the flowing medium builds up in the valve guiding surfaces) the less the tendency of the guiding area to stick and hinder valve operation.

Nozzle

The nozzle is a pressure-containing component in constant contact with the process media in both the open and closed valve positions. To promote reliability and safety, Consolidated flanged SRV nozzles are constructed from forgings, investment castings or centrifugal castings.

Spindle Pocket Connection

The connection between the spindle and disc holder in a Consolidated safety relief valve is a positive method of attachment. The Inconel snap ring and groove design make it virtually impossible to remove the spindle from the disc holder, unless the ring is compressed intentionally. This design requires a minimum amount of effort to disassemble during maintenance.

Design Simplicity

Consolidated safety relief valves use a minimum number of component parts, which results in a savings by minimizing spare parts inventory and simplifying valve maintenance.

Maximum Seat Tightness

Seat finish in a safety relief valve is critically important; otherwise, valve leakage can occur. Consolidated safety relief valve seats are precision-machined and lapped, which promotes positive seating and prevents loss of contained media.

The *Thermodisc*™ design offers a tighter closure and compensates for temperature variations around the periphery of the nozzle. Thermal distortion, which produces seat leakage, is minimized in steam service.

Cap and Lever Interchangeability

Sometimes it may be necessary to change the type of cap or lever in the field after a valve has been installed. All Consolidated safety relief valves are supplied so they can be converted to any type of lever or cap desired. It is not necessary to remove the valve from the installation, and the set pressure will not be affected when making such a change.

Valve Interchangeability

A Consolidated 1900 Series safety relief valve may be converted to several variations such as conventional to bellows, metal seat to soft seat, trim conversion to dual media (DM), gas (GS), liquid (LA) or steam (TD), requiring a minimum number of parts for lower cost of ownership.

Quality Material

All Consolidated safety relief valve castings and forgings are made to ASTM and ASME specifications and are subject to many rigid inspections. These rigorous processes, coupled with quality workmanship, promote a long, trouble-free valve life.

Scope of Design

Product Features

Reduction of Valve Bonnet Pressure

Closed bonnet valves are subject to variable pressure past the guiding surfaces when the valve is open. This adds a variable force to that of the spring, which can affect valve performance. An eductor tube can help reduce excess bonnet pressure and promote good valve opening and closing action.

The eductor tube reduces bonnet pressure by pulling discharging fluids out of the bonnet faster than the fluids can enter past the guiding surfaces. Consequently, the tube acts as a siphon through the drawing effect of the flow through the outlet side of the valve.

Eductor Tube Reduces Bonnet Pressure

During valve discharge, media flows through the clearance between the disc holder and guide, building up bonnet pressure. This adds a variable force to the spring force, which inhibits valve lift. The eductor effect of the medium flowing at high velocity through the valve outlet reduces bonnet pressure.

The greater lifting force (resulting from a reduction in bonnet pressure) introduces important advantages:

1. Uniform response to blowdown control adjustment
2. Positive, full-rated capacity at low overpressures
3. Better operation at higher back pressures with the eductor tube
4. Stability of valve lift and capacity during operation
5. When the valve opens, an increase in lifting force that breaks up slight corrosive deposits or surface film accumulates on the guiding surfaces and hinders valve action. (For severe corrosion applications, a bellows valve is recommended.)

Eductor Tube

Scope of Design

1900 Dual Media (DM) Dual Certified Valves

The patented innovation of the Dual Media trim design makes it the first and only spring-loaded safety relief valve in the industry that is “dual certified”, as defined by API Standard 520 Part 1, 10th Edition – Sizing and Selection. Dual Certified is defined as pressure relief valves that are both vapor/ gas flow certified, and liquid flow certified where dual certification is achieved without making any modifications or adjustments to the relief device when switching fluids during the flow testing.

The 1900 DM trim is engineered to perform on both liquid and/or gas media and is Dual Certified to meet dual media (liquid and gas) nameplate capacity stamping per ASME B&PVC Code Case 2787.

The 1900 DM trim is ideal for any liquid or gas application, two-phase liquid and gas, flashing or multiple relief case scenarios.

Pressure relief valve sizing rules require that when selecting a valve, it is based on the worst-case overpressure scenario with the largest required area to relieve the required capacity. This can lead to problematic and unstable relief scenarios such as:

- Using a standard gas certified trim to flow liquids creates chatter and damages valve components. This is not recommended.
- Using a standard liquid certified trim to relieve gas will extend the blowdown, typically in the range of ~25–30%. This requires bringing system pressures down as low as 70% of the valve set pressure for the valve to close causing valuable process media loss, increased fugitive emissions and loss in efficiency.

- The opening point of a liquid set standard liquid certified valve relieving on gas may be as much as 5% lower. This can cause seat leakage or premature valve opening when operating pressures are higher and there is a gas relief scenario occurring. Contrary, the opening point of a gas set standard gas certified valve relieving on liquid may be as much as 5% higher and is likely to chatter. These shifts in opening points may result in a similar shift in the point at which full lift is achieved.

The DM trim provides exceptional set pressure performance on gas and/or liquid, stable opening and closing and industry leading blowdown performance which ensures the system is efficiently protected from an overpressure event with gas and/or liquid as the relieving media.

With the 1900 DM trim’s fixed blowdown performance on liquid and on gas, it greatly reduces the loss of valuable process media, reduces fugitive emissions and provides reliable process efficiency.

The 1900 DM builds on the reliability of the 1900 Series and is offered in the same scope of inlet/outlet sizes, pressure classes, orifices designations and material offerings.

Trim Performance Characteristics						
Trim Type	Certified Media	Setting Media	Relieving Media	Set Pressure Performance	Blowdown Performance	Kd (Coefficient of Discharge)
1900 Dual Media Trim (DM)	Gas and Liquid per ASME CC 2787	Air/Nitrogen	Gas	Within ASME B&PVC Section VIII Tolerances	All Orifices Metal Seat (MS) <10% All Orifices O-ring Seat (DA) <15%	0.950
			Liquid			0.744
1900 Standard Gas Trim (GS)	Gas	Air/Nitrogen	Gas		< 7%	0.950
1900 Standard Liquid Trim (LA)	Liquid	Water	Liquid		< 12%	0.744
		Water	Gas	Open up to 5% low, Outside ASME B&PVC Section VIII Tolerance	~25–30% (Common for most liquid certified PRVs relieving gases)	0.950 (Not Certified)

Scope of Design

1900 Dual Media (DM) Dual Certified Valves

Design Options

The 1900 DM is offered with the same design options as the standard 1900 Series such as a bellows, balanced piston, soft seat and special material variations.

In addition, the 1900/1900 DM has a patented Cryodisc design that provides superior seat tightness performance in low temperature cryogenic applications.

Disc Design Availability

Valve Type	Disc Design			
	Standard Solid Disc			
	Liquid	Liquid Organic Heat Transfer Media	Vapor Organic Heat Transfer Media ⁽¹⁾	Gas ⁽¹⁾
1900 DM	X	X	X	X
1900-30 DM	X	X	X	X
1900-35 DM	X	X	X	X

1. A standard solid disc in a special heat treated martensitic 616 stainless steel or Inconel X-750 is an option for organic vapor, corrosive or NACE applications

Valve Type	Disc Design	
	Cryodisc	
	Cryogenic Liquid (32°F and below)	Cryogenic Gas (32°F and below)
1905-1912	X	X
1905-1912 (-30 Bellows)	X	X
1905-1912 (-35 Balanced Piston)	X	X

1. Cryogenic disc is optional for L1 and L2 material variations and mandatory for the L3 material variation. The standard cryogenic disc material is Inconel X-750 with Titanium Nitride coating.

Scope of Design

1900/1900 Dual Media (DM) Cryodisc

Most PRV leakage in cryogenic applications is a result of dramatic thermal stresses in the seating components which can rapidly lead to process waste and fugitive emissions:

Available for the 1900 liquid (LA) and gas (GS) trims and the Dual Media (DM) trim, the patented Cryodisc technology offers enhanced seat tightness before and after a relief event. The low temperature media creates thermal stresses in the material that deflect the patented disc thermolip downward creating uniform contact pressure on the nozzle seat resulting in enhanced seat tightness. Titanium Nitride (TiN) coating, an extremely hard ceramic material, is applied to the bearing surface prevent galling induced wear under extreme cryogenic conditions.

1900 Dual Media (DM) High Pressure (Block Body)

The 1900 DM High Pressure design combines the technology of the Dual Certified 1900 DM with a forged Block Body design to handle high pressure FPSO compression & auxiliary system applications.

Specifications

Orifices:	D - J Orifices
Set Pressure:	Up to 10,000 psig (689.5 barg)
Sizes:	1-13/16" x 3, 3 x 4
Inlet Connections:	Studded API 6A 10/15K flanges with ring joint nozzle, Grayloc™ and Techlok™ hubs available
Outlet Connection:	Studded ASME Class 300
Body/Bonnet:	Duplex (F51, F53, F55), F65 (non-code) alloy, SA182 F316 SS, SA105 CS, SA350 LF2 CS
Trim:	Nozzle/Disc - Inconel 718 is standard, F51/55 duplex materials with Stellite hard-facing is optional
Spring Material:	Inconel X-750
Seat Design:	Metal seat design only

Scope of Design

1900 Steam Trim (TD) Valves

The 1900 TD is specifically configured for steam service and organic heat-transfer media. It is certified to ASME Code Section VIII.

The Thermodisc is a specifically configured disc for use with high-temperature fluids. The Thermodisc concept has consistently contributed to valve tightness during more than 40 years of field-proven performance.

The martensitic stainless steel disc construction promotes high strength and toughness. As the valve set point is approached, the pressure-sealing effect of the Thermodisc assists in the tightness of the seat as does the rapid thermal equalization that occurs due to the thin-sealing section.

Steam Trim Internals

1900 Disc Design Availability

1900-35 Balanced Piston	-	X	X	X	X	X	-	-	X	-

1. Thermodisc standard material is a specially heat treated martensitic 616 stainless steel. It is also available in Inconel X-750 material. The Thermodisc design is not available for the 1900 DM.

Scope of Design

1900 Liquid Trim (LA & LA1) Valves

The 1900 uses the same Liquid Trim for applications that require ASME B and PVC, Section I and Section VII certifications.

The Liquid Trim (LA1) is certified for all ASME B and PVC Section I liquid economizer and thermal fluid heater applications.

The Liquid Trim (LA) is certified for all ASME B & PVC, Section VIII liquid applications.

Liquid applications are defined as:

1. The fluid remains liquid while flowing through the valve
2. Flowing fluid flashes going through the valve
3. For ASME B and PVC, Section VIII, certified and non-certified thermal-relief applications (thermal relief is to prevent excessive pressure caused by thermal expansion of trapped liquids). The LA trim offers blowdown performance with ranges from 7 percent to 12 percent below the set pressure. This valuable feature offers media conservation, a positive lift and smooth, chatter-free operation. Because of the short blowdown performance of this design, it is critical that the inlet connection always supports a pressure drop of 3 percent or less from the vessel to the valve as recommended by API 520.

Conversion of existing 1900 Series valves to liquid trim is available through the factory or your local *Green Tag™* Center.

LA/LA1 Trim Internals

Scope of Design

1900 Restricted Lift Valves

We offer the 1900 Series in orifice sizes ranging from the smallest “D” size to the largest “W” size. In order to accomplish certain valve functions, some special considerations should be made as shown below with the D and E orifice designs.

The D and E valves are restricted-lift versions of the “F” orifice valve. The lift is restricted by a limit washer to provide the equivalent effective orifice area for a “D” or “E” orifice.

The standard 1900 Series valves are also available with restricted lifts in orifices ranging from “F” to “W” for compressible media only.

Restricted lift valves can provide solutions for systems with inlet pressure losses greater than 3%, or cases where valves may be oversized and exhibiting signs of chatter.

API 526 Table 1 shows a 21% to 78% increase in effective orifice area from one selected orifice to the next lettered orifice. In some applications, the user may require an orifice somewhere in between so that the resulting rated capacity is lower. This

reduction in rated capacity can be achieved by restricting the lift. A restricted lift pressure relief valve has a reduced flow area (reduced effective orifice area), resulting in a lower rated capacity for the valve. A lower rated capacity, based on the reduced lift, will lower the inlet and outlet piping pressure losses and reduce the acoustic effects.

ASME B&PVC Section VIII, paragraph UG-136(a) (11) gives the requirements that must be met for restricted lift applications which states valves shall not have their lifts restricted to a value less than 30% of full rated lift, or 0.080 in. (2 mm). Paragraph UG-133(h) states that when sizing and selecting valves, the restricted lift nameplate capacity shall be determined by multiplying the capacity at full rated lift as defines in UG-131(e)(3) by the ratio of the restricted lift to the full rated lift.

Lift restriction is accomplished by installing a limit washer between the guide and disc holder as shown in the figure. The limit washer is cut to the appropriate length based on the lift required.

Restricted Lift

Conventional

Balanced Bellows

Scope of Design

Soft Seat Applications

Operating and Set Pressures

Where the operating pressure is close to the set pressure, seat tightness can be maintained at relatively higher operating pressures.

Seats Positioned for Correct Alignment

Mechanical vibration and pressure waves could lift the valve disc with each stroke and may cause flat metal-to-metal seats to rub together and become damaged.

The 45-degree metal-to-metal load-bearing seats in the Consolidated O-ring seat seal promote true alignment aided by full system pressure behind the O-ring, which effectively seals against leakage.

Corrosive Services

In some services, seating surface corrosion is the cause of valve leakage. In this type of service, the Consolidated O-ring seat seal will protect the metal seat on the nozzle against contact of the corrosive fluid thereby maintaining greater tightness.

DA soft seats without bellows

Foreign Matter and Slurry Service

Many times, foreign material such as pipe scale, welding beads, sand and dust particles may damage the metal-to-metal seating surfaces in a valve of this type when it is open and flowing.

The Consolidated O-ring seat seal can absorb the impact of most foreign particles without damage.

Hot Water Boiler Service

When a safety relief valve opens, hot water flashes into steam at the seating surfaces, and solid particles that float to the water surface are driven against the seating surfaces at steam velocities. Consolidated O-ring seat seal valves can withstand this type of service and remain tight to a greater degree than metal-to-metal seat valves.

Baker Hughes uses proven quality Teflon® O-ring seats for this service. In some pressure and temperature applications, Teflon is not resilient, and leakage may occur.

Benefits

Safety Relief Valve leakage that is aggravated by any cause is usually costly. In many cases, an expensive product is lost and maintenance costs increase. Consolidated O-ring seat seal valves are configured to eliminate leakage in troublesome applications and reduce overall costs. Should leakage occur, it is simpler and less expensive to replace the O-ring than to maintain metal-to-metal seats.

O-ring Conversion

1900 & 1900 DM Series metal-seated valves can be converted to O-ring seat seals by installing a few basic parts provided in a conversion kit.

Scope of Design

1900/1900 DM Soft Seat (DA) Option

The Double Seal Soft Seat

The double seal design incorporates the merits of both a soft seat and a metal seat design valve. The 45-degree metal seat offers the load-bearing surface to transmit spring force and the slotted O-ring retainer allows O-ring pressurization to accomplish the primary sealing function. This O-ring seal design can be used throughout the full pressure range of the valve. For pressure and temperature ratings of the seal, refer to the O-ring Selection Table in this section (pages 43 and 44).

Consolidated O-ring seat seal valves are bubble tight at 95 percent of set pressures over 100 psig (6.89 barg).

The following table reflects the percent of set pressure (popping pressure) at which the valve will be bubble tight on air.

Bubble Tight Pressures				
Set Pressure				Percent of Set Pressure
psig		barg		
min.	max.	min.	max.	
5	30	0.34	2.07	90%
31	50	2.14	3.45	92%
51	100	3.52	6.89	94%
101 to max. rating of valve		6.96 to max. rating of valve		95%

Consolidated O-ring seat seals provide positive closure at service pressures, closer to the set pressure than is possible with metal-to-metal seats. This assures continuous, trouble-free service and complete valve tightness after numerous "pops."

Note:

The Consolidated 1900/1900 DM O-ring design features a secondary metal-to-metal seat that becomes effective if O-ring integrity is lost due to external fire or other causes. The retainer is lapped to the nozzle at assembly, assuring seat tightness.

1900/1900 DM Soft Seat (DA)

Scope of Design

Soft Seat (DA) Option – How the Double Seal Works

Two unique features distinguish the Consolidated O-ring seat seal safety valve from other designs. These are the 45-degree metal-to-metal load bearing seats and the slotted O-ring retainer.

Double Seal

Three Essentials to a Tighter and More Secure Seat

1) Concentric Alignment

The nozzle bore and O-ring retainer are both machined to an angle of 45 degrees. This ensures that as the valve disc opens and closes, the O-ring is aligned concentrically against the lip of the nozzle. Close tolerance between the nozzle and the body, or between the body and the disc guide and disc holder, also help to ensure a tight seal when the valve is closed. Accurate alignment coupled with the load bearing function of the O-ring retainer virtually eliminates O-ring abrasion from valve action.

2) Maximum Sealing Force

On the back side of the O-ring retainer there are two small slots. When the valve is closed, process media enters between the machined seat of the nozzle and the O-ring retainer and proceeds up the slots behind the O-ring. This pressure forces the O-ring against the lip of the nozzle and the curved recess of the disc holder. As the pressure within the valve rises to set point, the O-ring is pressed tightly against the nozzle to maintain maximum sealing force until break-away pressure is reached.

3) O-ring Retention

When the valve opens, the pressure behind the O-ring escapes from the same two slots on the O-ring retainer. This prevents the O-ring from being ejected. Additionally, the O-ring encapsulating retainer prevents the O-ring from being pulled from its setting by the high velocity, low pressure discharge inside the upper valve body.

1. Other material variations are available. Balanced piston components will be per the bellows “-30” type, except in “X3” and “X4” variations. (S3, S4, etc.). In these cases, the materials for the piston, lock screws, seal ring expander, and piston guide may be changed. The Seal Ring will remain as Graphitar Grade 67.
2. With Flexible Graphite Fillers (Spiral Wound).
3. 1900 DM - Nozzle material for the 1918/28 orifices D-G will be Inconel X-750. Other materials are available depending on P/T.

Materials

1900/1900 DM Soft Seat (DA) Option Safety Relief Valve

Standard Material for 1900/1900 DM Soft Seat (DA) Safety Relief Valves	
Part Name	Materials ⁽¹⁾
Disc (K-T Orifice)	316 Stainless Steel
Disc Holder ⁽²⁾	316 Stainless Steel
Bonnet	ASME SA352 LCC CS
Disc Retainer	Inconel X750
O-ring Retainer ⁽³⁾	316 Stainless Steel
Retainer Lock Screw ⁽³⁾ (Not Shown)	316 Stainless Steel
O-ring Seat Seal	Select ⁽⁴⁾

1. Balance of materials is the same as 1900/1900 DM standard construction
2. Disc Holder material for D-J orifice, will be Monel for "M" variations and Hastelloy C for "H" variations.
3. O-ring Retainer material will be Monel for "M" variations and Hastelloy C for "H" variations. The retainer lock screw will be Monel with Nylon locking feature in the "M" variations and Hastelloy C with Nylon locking feature in the "H" variations.
4. Refer to pages 43 and 44 for O-ring Selection (Durometer and Temperature Limits).

Materials

1900 Steam Trim (TD) Option Safety Relief Valve

Standard Material for 1900 Steam Trim (TD) Safety Relief Valves

Adjusting Ring	316 Stainless Steel

1. Balance of materials same as 1900 standard construction.

Materials

1900/1900 DM Special Material and Service Options

The 1900/1900 DM Flanged Series offers various material options to satisfy customer needs and API standards. The most common options are listed in this section.

These material options are not the only available options however. Ask Baker Hughes for options not listed here. Specify the material construction classification using the construction variations such as: S2, H4, etc.

Options included are:	Page Number
• NACE Service (N1 and N2)	30
• Hydrofluoric Acid Service (HA)	32
• Stainless Steel (S2, S3 and S4)	33
• Alloy 20 (A1, A2, A3 and A4)	35
• Monel (M1, M½(MB), M2, M3 and M4)	36
• Hastelloy C (H1, H2, H3 and H4)	37
• Duplex (D1, D2, D3 and D4)	38
• Low Temperature - Process Fluid (L1, L2, and L3) (For media temperatures to -450°F or -268°C)	40
• Low Temperature - Ambient (C1 and C2) (For ambient temperatures to -50°F or -45.6°C)	41
• High Temperature (T1 and T2) (For media temperatures to 1500°F or 816°C)	42
• Lethal Service	43
• O-ring Selection	44

Many other special options not necessarily of a material nature are available. These include, but are not limited to, special facings on connections or special connections. Contact the factory for any special requirements you may have.

1. The materials in **red** denote variation from standard material construction.
2. Compliance to NACE MR0175 requires media and materials evaluation. Please contact factory sales.
3. N1 and N2 valves are for installations for compliance to NACE MR0103-2015 and prior editions.
4. Heat treated.
5. With Flexible Graphite Fillers (Spiral Wound).
6. 1900 DM - Nozzle material for the 1918/28 orifices D-G will be Inconel X-750. Other materials are available depending on P/T.

Materials

Hydrofluoric Acid (HA) Service

To meet the demanding requirements of extremely corrosive HF Alky service, Baker Hughes has, in conjunction with major designers and users in this industry, developed the HA variation. Extensive use of Monel Alloy 400, in the stress-relieved condition for critical components, has been utilized for this option.

NACE document 5A171 states, "In practice, occurrence of stress corrosion cracking may either be avoided by complete exclusion of oxygen or may be minimized by stress-relieving welded or cold formed parts." The HA materials should not be

confused with the M1-through-M4 materials used for other corrosive applications.

In addition to the special stress-relieved conditioned Monel 400 materials, a bellows seal and litharged-cured soft seat have been incorporated into this option. Long-term applications have shown excellent results in the most severe, moist, aerated HF Alky service.

- The materials in **red** denote variation from standard material construction.
- To specify valves, add material designation to the valve type, 1910L/HA or 1910-30L/HA.
- (Including Supplement S5)
PWHT is required for weld repairs per ASTM A216 paragraph 10, or if C.E. is above 0.40. Carbon equivalent shall be determined per ASTM A216, S11.2. Weld PQR shall include hardness test of PWHT area. Test piece to confirm that weld and weld heat-affected-zone hardnesses are 200 brinell maximum.
- Stress relieved.
- With Flexible Graphite Fillers (Spiral Wound).

- The materials in **red** denote variation from standard material construction.
- To specify valves, add material designation to the valve type, 1910L/A3 or 1910-30L/A3.
- Alloy 20 - ASTM B473 UNS N08020.

- Or Inconel X-750.
- With Flexible Graphite Fillers (Spiral Wound).
- 1900 DM - Nozzle material for the 1918/28 orifices D-G will be Inconel X-750. Other materials are available depending on P/T.

- The materials in **red** denote variation from standard material construction.
- To specify valves, add material designation to the valve type, 1910L/L2 or 1910-30L/L2.
- ASME SA352 LCC can be substituted for bases down to -50°F (-45.6°C) when requested.
- With Flexible Graphite Filler (Spiral Wound).
- With Titanium Nitride Coating.
- Available for 1900-DM Series. Optional for L1 & L2, Mandatory for L3.
- 1900 DM - Nozzle material for the 1918/28 orifices D-G will be Inconel X-750. Other materials are available depending on P/T.

2. To specify valves, add material designation to the valve type, 1920L/T2 or 1920-30L/T2.
3. All T2 valves have ASME Class 300 outlet flanges.
4. Consult factory for temperatures above 1500°F (815°C).

5. Carbon content must be 0.04% or higher.
6. Glide-Aloy Coated.
7. Slotted Yoke Bonnet for T2. Slotted Bonnet not available for liquid service.
8. With Flexible Graphite Filler (Spiral Wound).

Materials

Valves for Lethal Service

In some industries, there are lethal service applications which require special consideration. If your application may be for lethal service, please review this information. "Lethal Service" should be prominently indicated in your discussions, inquiries, or purchase orders.

I. Definition

ASME B and PVC, Section VIII (Division 1) states that it is the responsibility of the user to state that the valve will be in lethal service.

IMPORTANT:

Baker Hughes does not determine if a fluid is lethal. The customer must specify the fluid is lethal and paperwork should be clearly stamped to identify that the application is a lethal fluid.

The ASME Code definition is as follows:

Lethal Substance - Poisonous gases or liquids of such a nature that a very small amount of the gas or the vapor of the liquid, mixed or unmixed with air, is dangerous to life when inhaled.

ASME B31.3 - A chemical plant and petroleum refining piping standard, supplies a similar definition, which it calls a "Category M Fluid Service."

II. Valve Requirements for Lethal Service Application

- A. Only closed bonnet valves with a screwed or bolted cap or packed lever can be used for lethal service.
- B. Valve model numbers that are acceptable for lethal service after modification are 1905/1910 conventional and bellows flanged valves.
- C. It is recommended that a soft-seat design be used for improved tightness.
- D. When service temperature exceeds 450°F (232°C), bolting material review is required by Baker Hughes Engineering team.
- E. Use non-sparking material for flammable media. Examples are Bronze, 316 Stainless Steel, and Monel.

III. Base, Bonnet, and Cap Casting Requirements

- A. Each casting requires 100 percent visual inspection
- B. Each casting requires complete surface examination either by magnetic particle for steel castings or liquid penetrant for stainless castings.
- C. Each casting shall have radiographic examination.
- D. All repairs to base, bonnet and cap castings must be documented.
- E. All threads must be inspected for continuity of threads
- F. Hydro test should be 10 minutes.
- G. The base drain plug is to be sealed by seal welding a plug of the same material as the base.
- H. The bonnet vent is to be sealed in accordance with paragraph G for conventional valves (non-bellows). Bellows valves are to have the vent connection vented to a safe location.

IV. Additional Requirements

- A. Each bellows requires a mass spectrometer leak test to 1×10^{-7} cc/sec to be imposed.
- B. It is necessary to seal the nozzle-base joint. The customer must state its preference between a seal weld or O-ring joint, depending on conformance of its maintenance practice.
- C. The nozzle and disc require hydro testing with a hold time for a minimum of 10 minutes.
- D. Cleaning procedures and lubricants used shall be acceptable for lethal service.
- E. Back pressure testing is required.

1. Maximum set pressure for silicone compounds is half of the maximum value.
2. The E962-90D O-Ring can be used in steam service in applications down to 15 psig (1.03 barg).
3. Teflon will not be supplied for conditions that deviate from these ranges.

1. Contact factory for O-ring selection for various fluids.
2. Consult factory before using. For use with freon 134A/ester oil service.
3. Set pressure ranges from durometer table for 70-75 Durometer shall apply to these compounds (for nuclear service, radiation environment).
4. EPR962-90D can be used on steam service to lower pressure limit of 15 psig (1.03 barg).
5. Can be used upto 400°F (204°C) for steam applications.
6. Consult factory before selecting.

Accessories

Caps, Levers, and Accessories

Lifting Mechanisms

The purpose of the lifting mechanism is to open the valve when the pressure under the valve disc is lower than the set pressure. These mechanisms are available in three basic types: plain lever, packed lever and air-operated lifting device. The lifting lever may be used as follows:

1. To lift the disc from the valve seat periodically during the operation of equipment to be sure that the disc holder is not frozen in the guide as a result of corrosion, coking, sulphur deposits, etc. This will promote protection of the unit at all times. Operating pressure under the disc should be approximately 75 percent of the set pressure when lifting in accordance with the ASME Code; otherwise the lever assembly could be damaged.
2. To remove foreign particles that are sometimes trapped under the seat as the valve closes. Immediate cleaning of the valve seat with the pressure of the media, by use of the lifting lever, will correct an otherwise leaking valve, save maintenance costs at a later date and in some cases avoid equipment shutdown.
3. To vent equipment to the atmosphere or discharge piping.

Plain Lever

This lever assembly is not pressure-tight and should not be used where back pressure is present or where the escape of vapor discharging from an open valve is undesirable around the lever assembly.

Packed Lever

As indicated by the name, this lifting lever assembly is packed around the lever shaft, so that leakage will not occur around the upper part of the valve when the valve is open or when back pressure is present. The packed lifting lever should be used when positive protection against leakage is required.

Bolted Cap

Consolidated Standard Safety Relief valves are supplied with screwed caps but bolted caps are available.

Gag

The purpose of the gag is to hold the safety relief valve closed while equipment is undergoing an operational hydrostatic test. This is the only purpose for which the gag is intended, and it can be accomplished by pulling the gag hand-tight. Force should never be used. The gag should never be left in the valve during the operation of the equipment. It should be removed after each use and hung in a safe, convenient location and the sealing plug reinstated and properly torqued.

ASME B and PVC, Section I, Lever

- ASME Code requires Safety Relief Valves used in liquid economizer applications must be supplied with a lifting mechanism. Due to the relief of hot water, a packed lifting lever is required.
- ASME Code states that Safety Relief Valves used for liquid thermal fluid heaters shall not use a lifting mechanism. Valves used in such applications shall be specified with a bolted or screwed cap.

ASME B and PVC, Section VIII, Lever

- ASME Codes require that a lifting lever must be supplied with the valve for steam, air, and hot water service over 140°F (60°C) applications. While this need not be a sealed lifting mechanism, the ASME Codes do recommend that sealed lifting mechanisms be used. The lifting lever may be omitted under Code Case 2203, but Baker Hughes requires that all orders for pressure relief valves without levers or blowdown valves for steam, air, and water over 140°F (60°C) state specifically that the valves are being purchased per Code Case 2203. The purchaser is responsible for obtaining jurisdictional authorization for use of Code Case 2203.
- When ASME Code stamped valves are used for thermal relief applications, the ASME Code guidelines shall be followed in regard to lifting levers.

Accessories

Caps, Levers, and Accessories

Air-Operated Lifting Device

The Air-Operated Lifting Device uses an air cylinder to obtain lifting power to open the valve from a remote control station. Normal operation of the safety relief valve is independent of the lifting device.

Please specify actual required conditions, otherwise the device will be supplied to operate with at least 75 percent of set pressure under the disc in accordance with the ASME Code.

Requirements for special application:

valve size, set pressure, minimum pressure at which the valve must be kept open, air pressure for operator, or electrical characteristics for solenoid operation.

Regulated air, not to exceed 100 psig, is required for operation.

Air-Operated Lifting Device

Valve Position Indicators

A valve position indicator, in general, is a micro switch apparatus used for remote indication of the opening of a safety relief valve. It is designed to activate warning devices such as control panel lights or auditory indicators. This option enhances the control function of operators located in remote control stations. Please advise voltage requirements for proper selection of micro switch when ordering.

Other special options/accessories

Slotted Bonnet

Steam Jacket

Vent Bug Screen

(Available in 1900-30 bellows valve only)

Block Body

(High Pressure, Special Materials, Special Dimensions)

Accessories

Packed Lever

As indicated by the name, this lifting lever assembly is packed around the lever shaft, so that leakage will not occur around the upper part of the valve when the valve is open or when back pressure is present. The packed lifting lever should be used when positive protection against leakage is required.

Packed Lever

Plain Lever

This lever assembly is not pressure-tight and should not be used where back pressure is present or where the escape of vapor from an open valve is undesirable around the lever assembly. It is designed with either a one- or two-piece lever as illustrated below. The design is based on valve size and/or valve set pressure.

One-Piece Lever Design

Two-Piece Lever Design

Accessories

Bolted Cap

Consolidated standard safety relief valves are supplied with screwed caps, but bolted caps are available.

Bolted Cap

Cap with Gag

Cap with Gag

The purpose of the gag is to hold the safety relief valve closed while equipment is being subjected to an operational hydrostatic test. This is the only purpose for which the gag is intended, and it can be accomplished by pulling the gag hand-tight. Force should never be used. The gag should never be left in the valve during the operation of the equipment. It should be removed each time after using and hung in a safe, convenient location.

Bolt-on Jackets

Jacketing of Relief Valves

Baker Hughes offers simple solutions to your heating problems with Bolt-on Jackets for Consolidated valves.

Viscous materials that freeze or harden in relief valve nozzles create hazardous conditions. Process pipe jacketing or tracing may not offer sufficient heat to the area in and around the relief valve seat. During a pressure surge, some of the solid materials may stick in and around the seating area, keeping the valve from functioning and re-seating properly. This can result in leakage around the valve seating surface.

The solution to this problem is the Bolt-on Jacket, a two-piece aluminum casting has a steel pressure chamber embedded in the aluminum jacket casting. The pressure chamber is fabricated of standard pressure vessel materials for various heating fluids and service temperatures. The chamber is configured and tested in accordance with the ASME B and PVC, Section VIII, Div. I. The jacket casting conducts heat from the pressure chamber and rapidly distributes it evenly over the outer surface of the relief valve.

The aluminum casting distributes heat only, it carries no pressure load at any time. Heating fluid is transferred from one half of the jacket to the other by an external connector. A thin layer of heat transfer cement is used between the jacket and the relief valve to promote effective heat transfer by filling any air gaps between the jacket and the relief valve.

Bolt-on Jacket halves bolt together for quick installation and unbolt for ready access to the relief valve for easy

maintenance. The jackets cover from flange to flange providing uniform heat to all process-wetted surfaces. Standard service ratings for the jacket are 150 psig and 500°F. Higher ratings are available upon request.

Bolt-on Jackets may be ordered with adjacent flange coverage, and with a variety of heating medium connections. Canadian registration is available for all provinces.

Bolt-on Jackets are operating successfully on relief valves in many different process service applications worldwide. Buyers should consider jacketing the relief valves whenever the adjacent vessel or piping is heated in some manner. The following process applications typically require jacketing of the relief valve:

- Acrylic Acid
- Ammonium Nitrate
- Coal Tars
- Caprolactam
- Cyanuric Chloride
- DMT
- DNT
- Fluoropolymers
- LLDPE
- Olefins
- Phosphorous
- Polypropylene
- Polystyrene Resins
- Phthalic Anhydride
- Sulphuric Acid
- Sulphur Dioxide
- Some Surfactants
- Tall Oils
- TMA

Typical Bolt-on Jacket

To ensure we provide the proper jacket coverage, please answer the following questions:

1. Is the process operating at elevated temperatures?
2. What is the process?
3. What is the temperature of the process being maintained?
4. What heating medium is being used in your jacket? What pressure and temperature is this medium?
5. What type of jacket connections are required?
6. How is the temperature being maintained on the process piping and other equipment (valves, pumps, meters, etc.)?

The relief valve will probably need a Bolt-on Jacket if it is operating in one of the process services listed above or if the adjacent piping and equipment is heated.

Contact the factory for assistance.

Dimensions and Weights

1900/1900 DM Flanged Series Conventional Safety Relief Valve

This table applies to the standard 1900 Series regardless of materials of construction.

The table provides overall dimensions for standard valve size and pressure class offerings as shown on pages 5-9.

If the valve you are reviewing has an inlet or outlet size different from standard valve offerings, the dimensions "A" through "E" and weight may not apply. Consult the factory for non-standard valve dimensions.

Note:

Inlet and outlet combinations, as well as orifice sizes shown in the following tables, are compliant with API Standard 526, Latest Edition. For replacement valves that do not comply with this edition, contact the factory for verification of dimensions and inlet and outlet combinations. The U, V and W orifice valves are not API 526 orifice sizes.

1900/1900 DM Pressure / Temperature

Pressure / Temperature Tables

How to Use Rating Tables

The included tables specify important data about the valve including valve sizes, flange ratings, pressure and temperature limits, back pressure ratings and materials with allowable temperature ranges.

After determining valve size from the Valve Sizing section, or capacity tables in this section, select the proper set of tables and graphs (in the following pages) for the size valve.

Enter the pressure and temperature graphs and determine valve type. Review the table of data for that size valve to get other pertinent information.

Notes:

- The pressure/temperature limitations shown in the following tables are based on the limits specified in API526 applicable to the 1900/1900 DM Series supplied in standard materials of construction. For pressure/temperature limitations of valves made from special materials, consult the factory or the SRVS sizing program. (Note that 1900-30 bellows design valve supplied with the standard Inconel 625 bellows is limited to a temperature range of 400°F (204°C) to 1500°F (816°C).)**
- ASME Class 300 outlet flanges are permitted for mating purposes only on valves that are normally supplied with standard ASME Class 150 pressure rating. For back pressure applications exceeding the ASME Class 150 pressure rating, use SRVS sizing program or contact the factory for assistance.**
- When soft seats are used, they may govern the valve pressure/temperature rating.**

Procedure

Example	
Valve Set Pressure	500 psig (34.47 barg)
Back Pressure	50 psig (3.45 barg)
Temperature	100°F (37.8°C)
Valve	"J"

Enter the graph on page 71 for the "J" size, select set pressure on the bottom scale at 500 psig (34.47 barg), follow this line vertically upward until it intersects the 100°F (38°C) line. The selection is a 1910Jc valve.

Results

Referring to the table on page 70, the valve is 3" (76.2 mm) - 300 x 4" (101.6 mm) - 150 with a carbon steel body and spring. The back pressure limit is satisfactory for 50 psig (3.45 barg) back pressure.

Springs

Within given temperature limits, alloy steel springs are specified. Most springs are of alloy steel construction which offers superior strength and corrosion-resistant properties.

Materials

The operating temperature should be used to select the materials in valves for fire-sizing applications.

Minimum Set Pressures				
The minimum set pressures of the 1900 flanged valves are in accordance with the following table.				
Orifice	Low Set Pressure Limit ⁽²⁾			
	Conventional Valve		Bellows Valve ⁽¹⁾	
	psig	barg	psig	barg
D	5	0.34	15	1.03
E	5	0.34	15	1.03
F	5	0.34	15	1.03
G	4	0.27	15	1.03
H	4	0.27	15	1.03
J	5	0.34	10	0.68
K	5	0.34	10	0.68
L	6	0.41	10	0.68
M	6	0.41	10	0.68
N	9	0.62	10	0.68
P	7	0.48	10	0.68
Q	7	0.48	10	0.68
R	7	0.48	10	0.68
T	9	0.62	10	0.68
U	8	0.55	10	0.68
V	15	1.03	15	1.03
W	7	0.48	15	1.03

- The bonnet must be vented when a bellows is used.
- Valves with set pressure less than 15 psig cannot be stamped with the ASME stamp.

1. For temperatures other than 60°F (15.6°C) and specific gravities other than air, use formula sizing method.

2. Sizing: Valves may be sized for either ASME or API applications.

1900 TD Capacities

Valve Capacity for ASME B&PV Code Section VIII, for Saturated Steam ^{(1) & (4)}

Based on Set Pressure plus 10% overpressure or 3 psig (0.21 barg), whichever is greater showing 90% of actual capacity in accordance with latest ASME Code requirements.

1. Refer to page 1900.95 for correction factor applied for superheated steam.
2. The following Napier factor is applied to the capacity of pressures greater than 1423 psig (98.11 barg): $(0.1906 \times P_{psia} - 1000) / (0.2292 \times P_{psia} - 1061)$
3. Maximum permissible set pressure on steam is 2903 psig (200.15 barg). Value is interpolated.
4. Sizing: Valves may be sized for either ASME or API applications

1900 TD Capacities

Valve Capacity for ASME B&PV Code Section VIII, for Saturated Steam ^{(1) & (4)}

Based on Set Pressure plus 10% overpressure or 3 psig (0.21 barg), whichever is greater, showing 90% of actual capacity in accordance with latest ASME Code requirements.

1. Refer to page 1900.95 for correction factor applied for superheated steam.
2. The following Napier factor is applied to the capacity of pressures greater than 1423 psig (98.11 barg): $(0.1906 \times \text{Ppsia} - 1000) / (0.2292 \times \text{Ppsia} - 1061)$
3. Maximum permissible set pressure on steam is 2903 psig (200.15 barg). Value is interpolated.
4. Sizing: Valves may be sized for either ASME or API applications

1900 LA/LA1 & 1900 DM Capacities

Valve Capacity for ASME B&PVC Section I & VIII, for Water ⁽¹⁾																	
Based on Set Pressure plus 10% overpressure or 3 psig (0.21 barg), whichever is greater, showing 90% of actual capacity in accordance with latest ASME Code requirements.

1. Sizing: Valves may be sized for either ASME or API applications

1900 LA/LA1 & 1900 DM Capacities

Valve Capacity for ASME B&PVC Section I & VIII, for Water ⁽¹⁾

Based on Set Pressure plus 10% overpressure or 3 psig (0.21 barg), whichever is greater, showing 90% of actual capacity in accordance with latest ASME Code requirements.

1. For capacity on superheated steam, multiply saturated steam capacity by correction factor.
2. Convert set pressure from (psig) to (psia) flowing pressure.
3. psia flowing = [set pressure psig x overpressure] + 14.7

1900/1900 DM Series Valve Configuration Code

1. When either a mated or rated outlet flange is provided, the interchangeability number is modified per the Valve Configuration Code Table and the tag part number (for mated only) is added to the BOM.
2. DM only applicable if a Dual Media (DM) is selected.

1900/1900 DM Series Valve Configuration Code

H4	Hastelloy C [Complete Valve]
L1	Low Temperature Service [-21°F To -75°F]
L2	Low Temperature Service [-76°F To -150°F]
L3	Low Temperature Service [-151°F To -450°F]
T1	High Temperature Service [1001°F To 1200°F]
T2	High Temperature Service [1201°F To 1500°F]
A1	Alloy 20 [Nozzle and Disc]
A2	Alloy 20 [Internals, except Spring Assy.]
A3	Alloy 20 [All except Spring Assy.]
A4	Alloy 20 [Complete Valve]
HA	Hydrofluoric Acid [Anhydrous Hf Alky]
D1	Duplex [Nozzle and Disc]
D2	Duplex [Internals, except Spring Assy.]
D3	Duplex [All except Spring Assy., Stud/Nut and Bellows Assy.]
D4	Duplex [All except Stud/Nut and Bellows Assy.]

Bellows Selection	
Designation	Range
00	Non Bellows
30	Bellows
35	Balanced Bellows

1900/1900 DM Series Valve Configuration Code

Non-Standard Outlet								
Valve Type	Orifice	Standard Outlet Flange Rating	Actual Body Class Rating	Actual Outlet Flange Class	Mated "M" Rated "R"	Non Standard Outlet Code ¹	Additional Tag	Tag Part Number ⁽¹⁾
1905-1912	All	150	150	300	M	15	Yes	7592401
				600		16		
				900		17		
				1500		18		
				2500		19		
1912-1918	D-G	300	300	600	M	16	Yes	7592601
				900		17		
				1500		18		
1916	H-L			2500		19		
1900	All	150	300	300	R (FULLY RATED)	20	No	N/A
		> 150	600	600		21		
			900	900		22		
			1500	1500		23		
			2500	2500		24		

1. The configuration code is modified by adding the "Non-Standard Outlet Code" from this column to the interchangeability number. For example: the interchangeability number is -1 and the Configuration Code from this table is 15 then the interchangeability number is -115.

Service	
Designation	Type
